

- In the June–August 2026 quarter, the national unemployment rate was estimated at 9.6%, a twelve-month increase of 1.0 percentage points (pp).
- The estimated number of employed persons decreased 0.9% year on year.
- The decrease in the employed population was mainly due to the falls in the sectors of manufacturing (-7.6%), information and communications (-16.8%), and commerce (-1.1%).
- The twelve-month increase in the population outside the labour force (1.8%) was influenced by the rise in the routinely inactive (1.6%).
- Compared to the previous moving quarter, the seasonally adjusted unemployment rate rose 0.1 pp to stand at 9.4%.

Unemployment rate according to sex and nationwide total moving quarters

Unemployment

The national unemployment rate was estimated at 9.6%, a twelve-month increase of 1.0 pp that can be attributed to the rise in the labour force (0.3%) and the fall in employed persons (-0.9%). The increase in the number of unemployed persons (13.0%) was influenced by the rises in the unemployed with prior work experience (12.1%) and first-time job seekers (23.2%).

According to sex, the unemployment rate was 10.3% for women and 9.1% for men.

Employment

The year-on-year decrease in the estimated total number of employed persons (-0.9%) can exclusively be attributed to the fall in men (-1.7%) because the number of employed women rose 0.2% in the same period. Meanwhile, the number of absent employed persons (who represented 5.5% of the total employed population) decreased 1.2%, which is equivalent to a fall of 6,238 persons.

MOVING QUARTERS (2025–2026)

Unemployment rate (%)	Jun-Aug	Jul-Sep	Aug-Oct	Sep-Nov	Oct-Dec	Nov-Jan	Dec-Feb	Jan-Mar	Feb-Apr	Mar-May	Apr-Jun	May-Jul	Jun-Aug

(1) As of the publication of results of the February–April 2022 moving quarter, INE has been publishing a statistical note together with the results of the National Employment Survey (ENE). In order to provide performance and quality indicators, the note includes the main estimates and their respective disaggregations as well as AAPOR codes, in accordance with institutional statistical quality criteria. For more information, see the [ENE Statistical Note, no. 53](#) (in Spanish).

(*) INE defines available future starters as a subset of future starters. Future starters are persons who have not looked for work in the previous four weeks, because they will soon start a job, and they may or may not be available for work in the two weeks following the reference week. Future starters are included among the inactive population. Available future starters are defined as those who are available to work in the two weeks following the reference week, and they are added to the unemployed population for the calculation of the unemployment rate with available future starters (LU1) for statistical harmonization with the OECD.

MOVING QUARTER (June–August 2026)

Labour force participation rate	61.5%
Employment rate	55.6%
Unemployment rate	9.6%

Level (number of persons)

Labour force	10,263,145
Employed persons	9,273,745
Informally employed persons	2,440,977
Unemployed persons	989,400
Economically inactive persons	6,424,651

Twelve-month variations

Labour force	0.3%
Employed persons	-0.9%
Informally employed persons	0.3%
Unemployed persons	13.0%
Economically inactive persons	1.8%

Analytical rates

Unemployment rate with available future starters (LU1)*	9.9%
Combined rate of unemployment and involuntary part-time work (LU2)	16.2%
Combined rate of unemployment and potential labour force (LU3)	17.7%
Labour force pressure rate	17.3%

Labour informality

Informal employment rate	26.3%
Employment rate in the informal sector	14.7%

According to economic sector, the decrease in employed persons was influenced by the falls in manufacturing (-7.6%), information and communications (-16.8%), and commerce (-1.1%). According to occupational category, the decrease can be attributed to the falls in formal wage earners (-2.9%) and unpaid family workers (-4.0%).

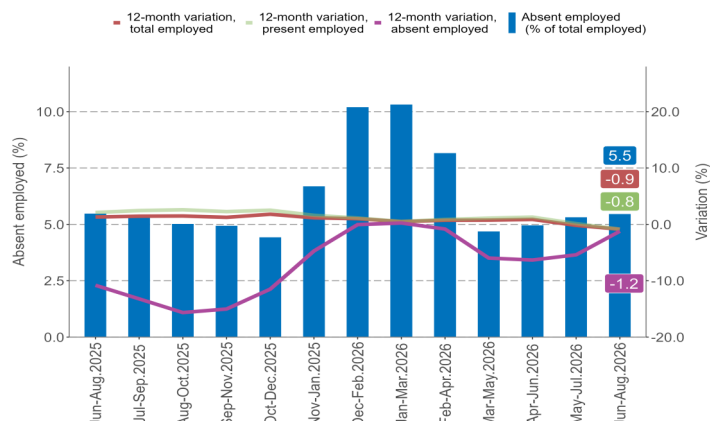

The informal employment rate rose 0.3 pp year on year to stand at 26.3%. By sex, the increase in the number of informally employed (0.3%) can exclusively be attributed growth of women (2.0%). By occupational category, the increase was mainly due to the rise in domestic workers (14.6%).

Labour participation

The participation rate fell 0.3 pp year on year to stand at 61.5%, and the employment rate fell 0.9 pp to stand at 55.6%. In the same period, the variation in the population outside the labour force (1.8%) was influenced by the rises the routinely inactive (1.6%) and inactive persons who are potentially active (3.4%).

Twelve-month variation of employed persons by type of employment and proportion of absent employed in the total number of employed, nationwide total

moving quarters

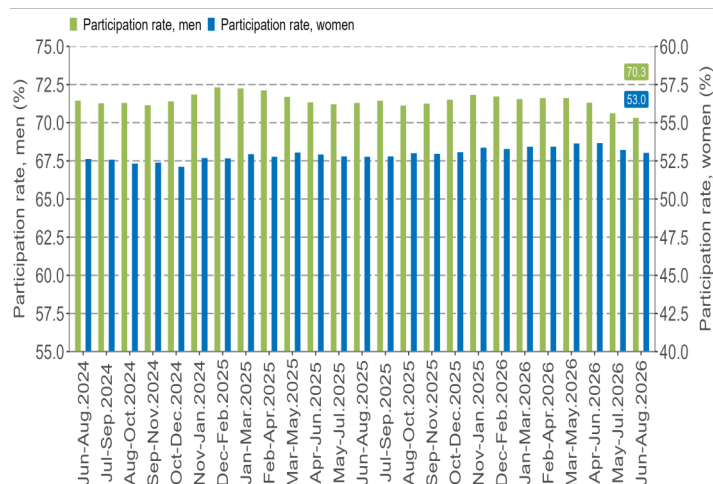

Employed persons absent from work

The twelve-month fall in employed persons (-0.9%) was led by the increase in those classified as present at their job (-0.8%). In the same period, the number of absent employed persons, which represented 5.5% of the total number of employed persons, decreased 1.2% (equivalent to a fall of 6,238 persons).

Employed persons by age bracket

By age bracket, the variation in the employed population (-0.9%) was influenced by decreases in the brackets 25–34 years (-5.1%) and 15–24 years (-4.9%). The decrease in employed men (-1.7%) was led by the fall in the bracket 25–34 years (-5.4%), while the increase in employed women (0.2%) was due to the rise in the bracket 65 years and over (10.5%).

Participation rate according to sex, nationwide total

Unemployment rate according to sex

The unemployment rate for men increased 1.1 pp year on year to 9.1%, which was the result of the lower magnitude of the fall in the labour force (-0.5%) than in employed men (-1.7%). Meanwhile, the increase in unemployed men (13.7%) was influenced by the rises in the unemployed with prior work experience (11.4%) and first-time job seekers (46.9%). For men, the participation rate fell 1.0 pp to stand at 70.3% and the employment rate fell 1.7 pp to 63.9%. The main influences on the increase in the number of men outside the labour force (4.3%) were the rises in the routinely inactive and inactive persons who are potentially active.

The unemployment rate for women increased 1.0 pp year on year to stand at 10.3% as a result of the faster growth in the labour force (1.3%) than in employed women (0.2%). In the same period, the increase in unemployed women (12.2%) was influenced by the rises in the unemployed with prior work experience (12.8%) and first-time job seekers (6.2%). For women, the participation rate rose 0.2 pp to stand at 53.0% and the employment rate fell 0.3 pp to stand at 47.6%. The increase in women outside the labour force (0.3%) can be exclusively attributed to inactive women who are potentially active.

Seasonally adjusted unemployment rate

Compared to the previous moving quarter, the seasonally adjusted unemployment rate increased 0.1 pp to stand at 9.4%. The increase can be attributed to the lack of variation in the labour force, which in turn was due to the variations in the unemployed (0.8%) and the employed (-0.1%). For men, the unemployment rate increased 0.1 pp to stand at 8.7%. For women, the unemployment rate increased 0.1 pp to stand at 10.2%.

Economic activity

The twelve-month decrease in the employed population (-0.9%) can be attributed to falls in manufacturing (-7.6%), information and communications (-16.8%), commerce (-1.1%), and public administration (-3.4%). The main increases were observed in administrative and support services (8.6%), construction (3.3%), and households as employers (7.8%).

The decrease in employed men (-1.7%) can mainly be attributed to the fall in manufacturing (-10.7%). The twelve-month increase in employed women (0.2%) can mainly be attributed to the rise in accommodation and food service (8.3%).

Occupational category²

By occupational category, the decrease in employed persons (-0.9%) was led by falls in formal wage earners (-2.9%) and unpaid family workers (-4.0%). The main increases were in the categories of own-account workers (3.1%), domestic workers (10.0%), and employers (5.9%).

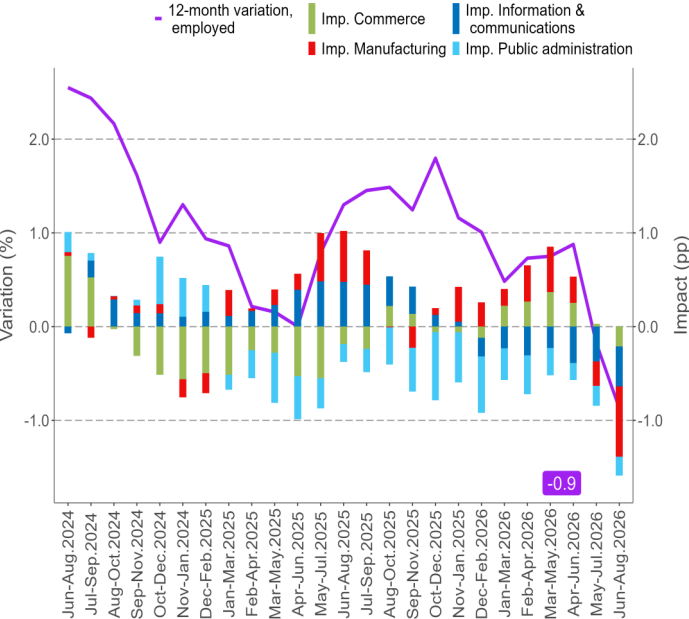

The decrease in employed men (-1.7%) was led by fall in formal wage earners (-3.3%). The increase in employed women (0.2%) was mainly due to the rise in own-account workers (4.4%).

Labour informality

The increase in informally employed persons (0.3%) can be exclusively attributed to the rise in women (2.0%) because the number of informally employed men fell 1.2% during the period. By economic sector, the increase can mainly be attributed to the rises in transport (8.6%) and administrative and support services (10.2%).

By occupational category, the variation in informally employed per-

* These four economic sectors include the highest positive impacts in the latest moving quarter. Sectors with negative impacts have been excluded.

sons was influenced by increases in domestic workers (14.6%) and wage earners of the private sector (1.1%).

The informal employment rate increased 0.3 pp year on year to 26.3%. For women, the informal employment rate rose 0.5 pp to stand at 28.3%. For men, the rate rose 0.1 pp to stand at 24.8%.

Informal employment rate (%)	MOVING QUARTERS (2025–2026)

(2) This analysis uses the International Classification of Status in Employment (ICSE-93). See Appendix 2 for the new analysis with the International Classification of Status in Employment (ICSE-18).

Hours actually worked

The volume of work, as measured by the quantity of hours per week actually worked by employed persons, decreased 2.4% year on year. Likewise, the average number of hours worked decreased 1.6% to stand at 36.4 hours. Men worked an average of 38.6 hours, and women worked an average of 33.5 hours.

Hours usually worked

The twelve-month decrease in employed persons (-0.9%) was influenced by the falls in those who work 45 hours per week (-45.5%) and by those who work 46 hours and over (-1.0%). In the same period, increases were observed in those who work 31–44 hours per week (4.9%) and part time, or 1–30 hours (3.3%).

(**) This bracket represents part-time employed persons as defined in the Labour Code in article 40 bis.
(***) Voluntary part-time workers (VPT) and involuntary part-time workers (IPT). Percentage of participation (%) and impact (pp) compared to the total of part-time employed persons.
(NS/NR) Beginning with the subsample of January 2020, the main questionnaire of the ENE includes the option Not sure/No response.

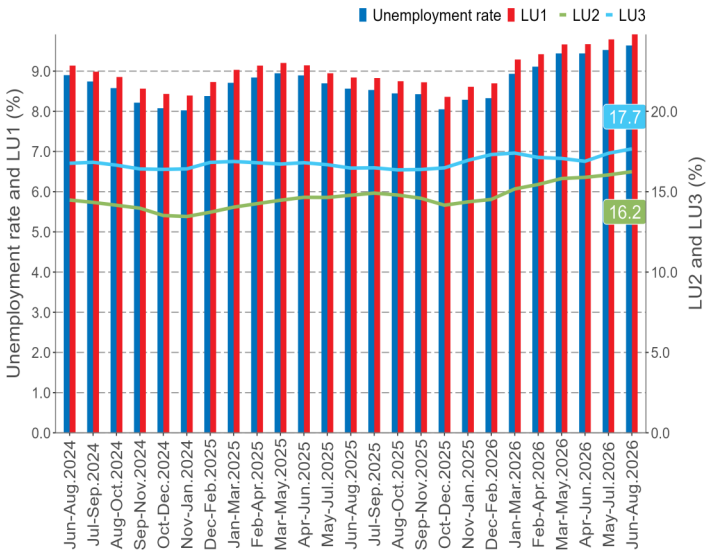

Unemployment rate with available future starters (LU1)³

The unemployment rate with available future starters increased 1.1 pp year on year to stand at 9.9%. The variation can be attributed to the rise in the unemployed (13.0%) and the fall in available future starters (-1.0%).

Combined rate of unemployment and involuntary part-time employed (LU2)⁴

The combined rate of unemployment and involuntary part-time work increased 1.4 pp to stand at 16.2%. The variation in the LU2 can be attributed to the increases in unemployed persons (13.0%) and involuntary part-time employed persons (6.9%) as well as to the decrease in available future starters (-1.0%).

Rates of unemployment and labour underutilization, nationwide total moving quarters

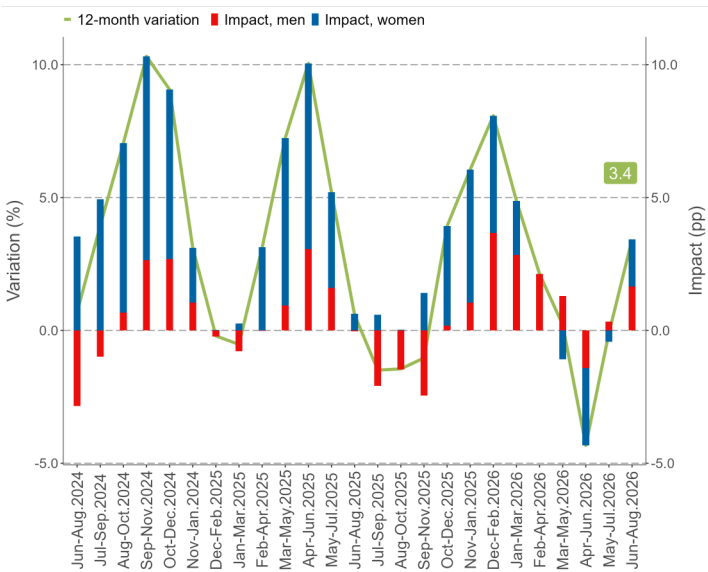

Combined rate of unemployment and potential labour force (LU3)⁵

The potential labour force, also known as inactive persons who are potentially active, increased 3.4% year on year as a result of the growth in women (3.1%) and men (3.9%).

This category mostly consists of persons who were not seeking a job but who were available to work. Thus, they would become potential entrants to the labour force if their expectations of finding a job improved.

The combined rate of unemployment and the potential labour force increased 1.2 pp year on year to stand at 17.7%. The indicator stood at 15.6% for men and 20.2% for women, and the gender gap was 4.6 pp.

Twelve-month variation of the potential labour force and impact according to sex, nationwide total moving quarters

(3) LU1 indicator = (unemployed persons + available future starters) / (labour force + available future starters)
(4) LU2 indicator = (unemployed persons + available future starters + involuntary part-time workers) / (labour force + available future starters)
(5) LU3 Indicator = (unemployed persons + available future starters + potential labour force) / (labour force + available future starters + potential labour force)

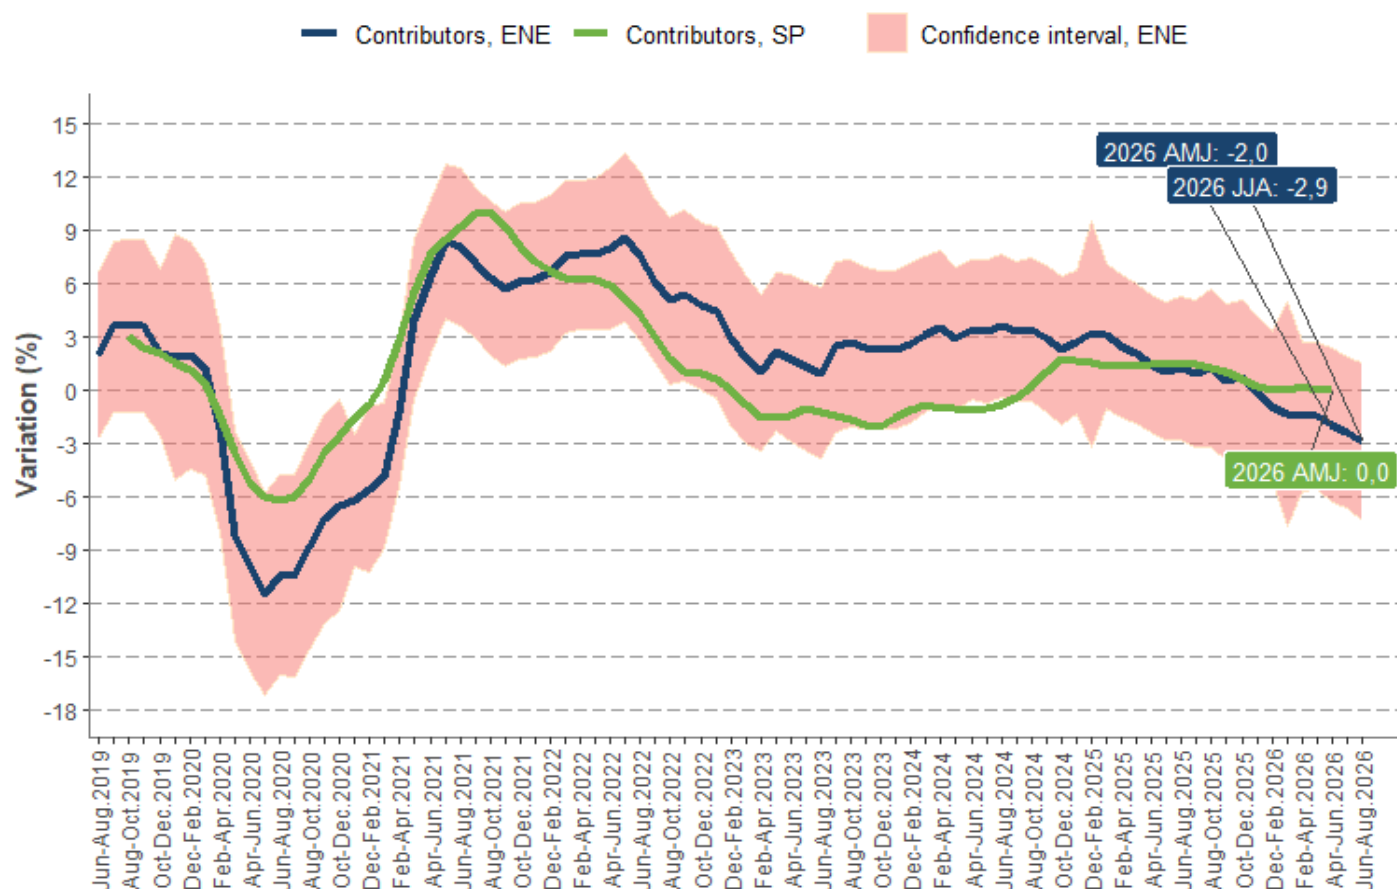

Appendix 1: Contrast with administrative records⁶

According to records from the Superintendency of Pensions (SP)⁷ on dependent contributors to private pension fund administrators (AFP)⁸, which have a two-month delay compared to the results of the National Employment Survey (ENE), the number of dependent contributors in the April–June 2026 moving quarter was 5,755,106. In contrast, there were an estimated 5,896,276 contributors in the same period according to ENE data. The SP figure is within the confidence interval of the ENE estimate.

For the April–June 2026 quarter, the number of contributors remained unchanged year-on-year, according to SP data. In contrast, ENE data for the same period showed a decrease of 2.0%, which was not statistically significant. In subsequent quarters (for which SP data is not yet available), ENE data showed variations of -2.4% in May–July 2026 and -2.9% in June–August 2026, but these decreases were not statistically significant.

The net effect of the increase in women (0.3%) and decrease in men (-0.2%) resulted in a lack of variation in contributors in the April–June 2026 quarter, according to SP data. In contrast, ENE data showed that there was a decrease driven by falls in men (-1.9%) and women (-2.0%). However, these variations were not statistically significant.

Development of twelve-month variation of contributors, estimate (ENE) and statistical series of the pension system moving quarters

(6) This section addresses methodological issues described in the technical note published on 31 December 2018 (available at *Sección Publicaciones y Anuarios/ Publicaciones*): <https://www.ine.cl/estadisticas/sociales/mercado-laboral/ocupacion-y-desocupacion>.

(7) In this section, the data on dependent contributors whose employers make normal payments to the individual capitalization accounts of AFPs is taken from the SP website.

(8) The contributors are active affiliates with a formal employment relationship with an employer.

Appendix 2: A New Dimension of Analysis: International Classification of Status in Employment (ICSE-18)⁹

The International Classification of Status in Employment (ICSE-18) established by the International Labour Organization (ILO) at the 20th International Conference of Labour Statisticians (ICLS) in 2018 replaces the 1993 International Classification of Status in Employment (ICSE-93) as a standard reference for the measurement and classification of employment status. In contrast with the ICSE-93 (organized by type of work contract or agreement and centered on the distinction between wage labour and independent work), the ICSE-18 adopts a multidimensional approach based on the type of authority that the person exercises over the economic unit and the type of economic risk to which he or she is exposed, which enables a better representation of the diversity of labour relations in contemporary labour markets.

Among its main innovations, ICSE-18 introduces the category of dependent contractors, which refers to individuals who enter into commercial contracts (rather than employment contracts) to provide goods, services, or labour to another economic unit but who maintain a relationship of economic or organizational dependence on that unit. Under ICSE-93, these individuals were commonly classified as own-account workers or dependent workers. The ICSE-18 thus distinguishes at its second hierarchical level seven categories of status in employment: employers, own-account workers, dependent contractors, wage earners of the private sector, wage earners of the public sector, domestic workers, and unpaid family workers.

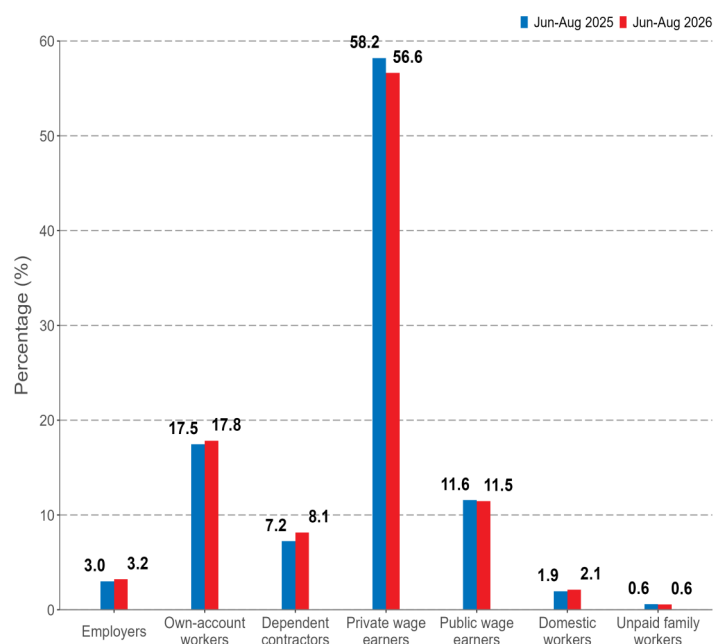

In the current moving quarter, the total number of employed persons according to status in employment (ICSE-18) was mainly concentrated in wage earners of the private sector with 5,253,481 employed persons, which is equivalent to 56.6% of the total. Following were own-account workers (1,653,696 employed persons, or 17.8%), wage earners of the public sector (1,063,638 employed persons, or 11.5%), dependent contractors (755,419, or 8.1%), and employers (297,743, or 3.2%).

By employment status (ICSE-18), the year-on-year decrease in the employed population (-0.9%) was led by the falls in the number of wage earners of the private sector (-3.5%), wage earners of the public sector (-1.7%), and unpaid family workers (-4.0%). The main increases were in the categories of dependent contractors (11.7%), own-account workers (1.2%), and employers (5.9%).

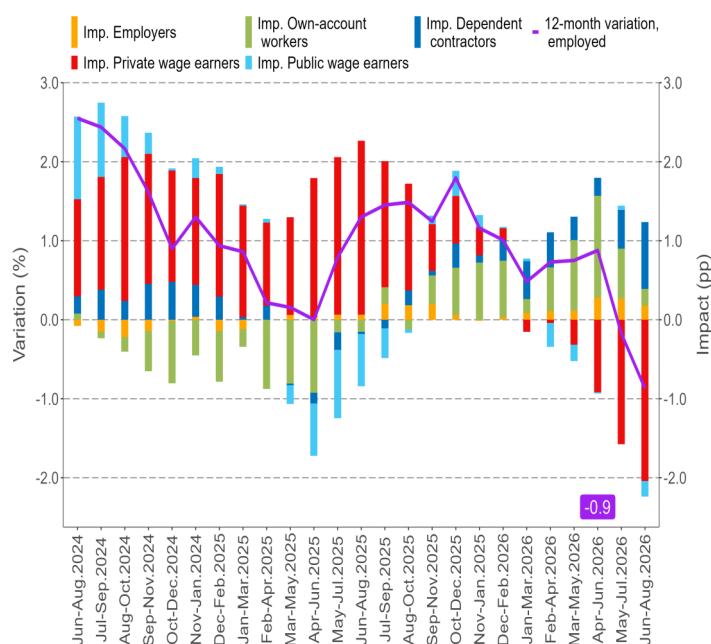

The decrease in employed men (-1.7%) was led by the fall in wage earners of the private sector (-4.0%). The increase in employed women (0.2%) was mainly due to the rise in own-account workers (4.5%).

The year-on-year increase in dependent contractors (11.7%) was due to the rise in the number of workers with economic risk¹⁰ (16.9%), organizational dependence¹¹ (11.0%), and wage earners with a commercial contract¹² (5.2%).

(9) This section addresses the methodological issues described in the technical note published on 31 July 2026 (available in Spanish at the following link: <https://www.inec.gov.cl/docs/default-source/ocupacion-y-desocupacion/publicaciones-yanuarios/separatas/nuevas-dimensiones/nuevas-dimensiones-7.pdf>)

(10) This situation occurs when an employed person does not receive wages, salary, or daily pay and instead receives another form of variable compensation; the employer does not pay the employee's social security or health insurance contributions; and the employee does not have a written contract.

(11) Organizational dependence refers to certain organizational aspects of work, such as the schedule, the location, the type of product, and the price of products that are determined by a third party, not by the worker.

(12) Wage earners with a commercial contract refers to wage earners who issue an invoice for professional services of their primary occupation.
